Honeypot Tool

Project Review

The tool create and deploy a sophisticated set of traps that will help organizations identify attackers.

The tool is built in the form of Microservices and monitors the actions of attackers on the network.

Project Background

Build an advanced tool for creating and deploying set of trap that will help organizations identify attackers

A Honeypot is a tool that deceives attackers into thinking they have hacked into thinking they have hacked into the organization's real network, when in fact they are in a fake network defined as a trap.
